## **Barrie Manlift Certification**

Barrie Manlift Certification - The Elevated Platforms and Manlifts Certification program helps to provide the needed training on the work practices, safe operating procedures, rules and regulations regarding the everyday activities for the operators of this machinery. The program has been designed for individuals who are actively involved in these activities or individuals who have a basic understanding of this equipment.

During the past couple of decades, aerial platforms and manlifts have become a common sight on construction job sites and in industrial maintenance applications. These machines provide an easy way to lift staff close to what has to be performed on a stable platform apparatus, enabling workers to carry out tasks with greater safety and comfort rather than being perched on top of ladders or scaffoldings.

The manlift is similar to other industrial devices in that they are safe when utilized properly. Since they elevate workers above ground level or floor, accidents can occur easily and this may cause serious fatalities or injuries for both the operators of the manlift and any passerby who might be unlucky enough to be standing below.

Manlifts come in a variety of types. The majority fit into 1 or 2 categories: the scissor lift, which is capable of moving upward and downward and the articulating boom lift, which can move both horizontally and vertically.

## **Protecting Staff**

It is essential to offer right training for you operators. Many companies which rent these equipment would provide on site training. Each and every worker who will be working on the machinery or operating it must receive training in safe operations. It is likewise essential that only those employees who have received training must be authorized to operate the controls. Communication rules and operating procedures must be clear. Therefore, workers on the ground should not operate controls without the knowledge and approval of any employees inside the basket.

Those staff who would be occupying the basket are required to wear right fall protection like for instance lanyard and a harness. That protection must be connected to the manlift itself and not to a surface nearby. The worker has to make sure that he or she has made any adjustments required to reflect the change in fall distance if the height of the work area changes.

To make sure that the manlift is in good operating condition, manlifts must be tested and inspected each day. Prior to the equipment being utilized, whichever defects should be re-inspected and fixed.
