

## Barrie Forklift Training Course

Barrie Forklift Training Course - Federal and industry regulators have established the criteria for forklift safety training based on their existing regulations and standards. Individuals wanting to use a forklift must finish a forklift training course prior to making use of one of these equipment. The accredited Forklift Operator Training Program is designed to offer trainees with the practical skills and knowledge to become a forklift operator.

Vehicle and Mobile Equipment safety rules which apply to forklift operation include pre-shift checks, and regulations for lifting and loading.

An inspection checklist must be carried out and given to the supervising authority prior to starting a shift. When a maintenance issue is uncovered, the utilization of the specific machine must be stopped until the issue has been dealt with. To be able to indicate the machinery is out of service, the keys need to be removed from the ignition and a warning tag placed in a visible location.

Safety regulations for loading would comprise checking the load rating capacity on the forklift to know how much the equipment can handle. When starting the equipment, the forks should be in the downward position. Bear in mind that there is a loss of about 100 pounds carrying capacity for every inch further away from the carriage that the load is carried.

Lifting must start with the driver moving to a stopped position approximately three inches from the load. The mast must then be leveled until it has reached a right angle with the load. Raise the forks to one inch under the slot on the pallet and drive forward. Afterward lift forks four inches. Tilt back the load to secure it for moving. Drive the lift backwards if the load obscures frontal vision. Check behind and honk to alert other workers. Do not allow forks to drag on the ground.

The load should be loaded by the forklift in such a way that ensures the load is secure and will not create a danger to other people or objects. Restraining loads is needed for materials which could shift during transport and destabilize the forklift.

Drums can be strapped together to be able to prevent movement and shifting of the drums. Operators of forklifts must drive slowly when transporting liquids, to lessen instability in the forklift.
