Barrie Telehandler Certification

Barrie Telehandler Certification - Telehandler certification courses are both for operators who have some experience driving a standard forklift and for those with no experience. The real-world training provided by these courses produces graduates well versed in the correct and safe utilization of these kinds of machines.

Telehandler certification programs can be completed at a third party location or at the work site of the trainees. To get the formal training at a certain training facility, the manufacturer may work out a licensing agreement to bring other individuals to a training facility. This alternative offers trainees with the chance to learn to use the machinery in a controlled environment. Upon completion, people who participated receive a license or certification to use this type of machinery.

With the latter option, a qualified instructor is sent to a work site to provide on-location training. This alternative ensures that the trainee is instructed on actual machinery which will be used on the job, and prepares the one training for the demands of that specific environment. Trainees learn about potentially dangerous situations that could take place on the actual work location. The instruction focuses on any circumstances that are specific to the work site, allowing operators to be ready to handle these elements more safely.

The word "telehandler" is an abbreviated version of "telescopic handler," meaning an equipment which has a telescoping or extending arm supporting a fork. A telehandler has different controls and characteristics just like a forklift. A telehandler has the capability of lifting and transporting loads up and away from the vehicle. Incorrect use of telehandlers could result in serious accidents. If load restrictions are exceeded, the machine can tip due to excess weight on the lift. It is the responsibility of the operator to know load restrictions and to safely make use of these machines.

"Conversion" classes are designed for operators who have been certified to make use of a forklift. These conversion classes would teach the differences between the operation of a forklift and a telehandler, all the while trying to avoid repetitive information that the forklift operator is already familiar with. For trainees who have no past experience making use of telehandler machinery, training includes the basic utilization and operation of the equipment. Some organizations provide refresher programs as well.
